

DYNAMIK

Internal Sports Wall Panels

- Sports Flooring
- Acoustic Walling
- Track & Gym
- Maintenance & Protection

DYNAMIK

With over 20 years' experience, DYNAMIK are leading providers of indoor sports solutions including sports walling, sports flooring, track and gym surfaces.

We provide the specification, supply and installation of premium sports systems, enabling us to offer solutions that perfectly meet both the needs of a facility and its users.

Our structural panels provide a durable and cost-effective solution when installed from floor to soffit.

Our premium sports wall panels come pre-finished in a range of colours and wood effects, making them easy to clean, highly durable and decorative. Using perforated acoustic panels creates an ideal environment for sport and education.

Official Partners

| What We Offer

- Solid & Perforated (Acoustic) sports wall panels
- Fabric Acoustic Panels by DYNAMIK
- Specification Service
- New build or Refurbishment options
- Range of colours or wood effects
- Easy fix, clip system
- Fire-Rated Panels & Factory Applied Finishes

| Our Credentials

- Over 20 years supporting British Sport
- Member of the Sports Facilities Group (SFG)
- Meets Sport England requirements
- Manufacturing & Installation Expertise
- RIBA Product Selector, BIM & NBS Source
- SAPCA Indoor Sport Members
- Governing Body Supply Partnerships

Introduction

DYNAMIK Internal Sports Walling panels are both durable and cost effective and can be fitted from floor to soffit. Perforated (Acoustic) Sports panels can be easily incorporated above door height to provide an acoustic solution.

Additionally, Fabric Acoustic Panels by DYNAMIK can be fitted directly onto any solid wall to provide an instant acoustic Class A sound reduction solution, ideal for refurbishment projects.

DYNAMIK Internal Sports Wall Panelling

The DYNAMIK Panels provide a highly decorative and durable solution for busy sports hall environments. With high scratch and impact resistance, the panels are designed to be an integral component of the internal wall construction and be fitted from floor to soffit.

Solid panels can be combined with Perforated (Acoustic) panels to provide a continuous, flush wall finish.

Principle Features

Durability & Impact Resistance – Provides superior impact and scratch resistance from balls, equipment and hall users.

Time & Cost Savings – Can be installed as an independent wall system which can be fixed directly to SFS or timber studwork. This eliminates the need for blockwork and other wet trades.

Factory Finished – Every panel is factory finished with a low maintenance, UV resistant, durable surface that does not require re-finishing over the life of the product.

Secret Clip Fixings – The supplied secret clips offer a fast and easy panel installation which eliminate unsightly surface fixings.

Fire Performance – The panels are fire rated to comply with Building Regulations.

Colours – The panels are available in a range of standard colours or wood effects.

Solid panel

Perforated (Acoustic) panel

| Fixings & Installation

The panels can be fixed to metal or timber vertical studwork. A black acoustic fleece is placed over the studwork to “effectively” hide the gap between the panels and make the black metal brackets appear “invisible”. The panels are then installed using the supplied secret clips to ensure a consistent spacing between adjoining boards. Insulation must be incorporated behind the perforated panels only, this achieves the required reverberation reduction and acoustic performance.

Technical & Performance Specifications - Solid & Perforated (Acoustic) Panels

Panel Face	Factory finished, available in a range of colours or wood effects
Panel Backing	Engineered Board
Fire Performance	Fire rated to European Class B or C
Panel Sizes (l x w x d)	Solid: 2400mm x 1200mm x 18mm / 2400mm x 592mm x 18mm Perforated: 2400mm x 1200mm x 18mm / 2400mm x 592mm x 18mm (confirm prior to final design)
Compliance	Compliant with Building Regulations
Panel Weight	Solid Panels: 40.60kg / 19.92kg Perforated Panels: 38.72kg / 18.96kg
Acoustic Performance	Class C - Perforated panels with insulation

DYNAMIK Acoustic Fabric Panels

Durability & Impact Resistance – A high density glass fibre core designed for superior impact resistance from balls, equipment and hall users. Certified for sport usage.

Time & Cost Savings – The panels are easily installed to blockwork, studwork or plasterboard providing a cost effective acoustic solution ideal for refurbishment.

Channel-Free Fixing – The supplied impaling spikes offer a fast panel installation method and eliminate unsightly t-trim or corner fixings.

Fire Performance – The panels are fire rated to National Class 1 to comply with Building Regulations.

Colours - Panels are custom made in over 75 fire rated coloured fabrics to provide a modern appearance that complements the sports hall design.

Installation

Installation is quick and easy since each panel only weighs 14.5kg and can be fixed to a range of solid surfaces including timber, concrete, masonry, or plaster. UK manufacture allows for a fast order-to-site process.

Technical & Performance Specifications - Acoustic Fabric Panel

Panel Sizes	2700mm x 1200mm (Other panel sizes available on request)
Panel Depth	40mm
Panel Weight	4.5 kg / m ²
Fire Performance	National Class 1
Acoustic Performance	Class A (0.95 NRC)
Compliance	Building Regulations, ESFA & Sport England compliant

Fabric Finishes

The Acoustic Sports Panels are available in a large range of coloured fire-rated fabrics including the following:

Rum

Dolphin

Ocean

Carron

Glass

Calypso

Colour & Wood-Effect Finishes

The Solid & Perforated Sports Panels are available in a wide range of wood-effect & solid colour finishes, including:

White Oak

Light Oak

Sonoma Oak

White

Light Ivory

Silver Grey

Light Grey

Grey

Sky Blue

Pastel Blue

Sage

| Sport Hall Acoustics Explained

Performance Standard & Regulations

High sound levels are experienced within the majority of busy sports and activity spaces. To be able to communicate clearly, reductions in reverberation and acoustics benefits teaching staff, coaches, and players alike.

The overall objective of the acoustic performance standards is to ensure that the design and construction of school buildings, including sports halls provide acoustic conditions that enable effective teaching and learning.

It is accepted that noise and poor acoustic design have a detrimental effect on pupils' academic performance and teachers' vocal health.

Pupils with additional learning needs or hearing impaired pupils are particularly susceptible to the negative effects of poor acoustic design.

Practically speaking this means reverberation time (T_{mf}).

What Do We Mean By Reverberation Time?

Reverberation time is one of the key determinants of room acoustic quality, and the factor to control with regard to sound absorption. It is the time it takes for a sound to reduce by 60db within a given space. It is measured at different frequencies since certain frequency ranges are more important than others.

How Can We Control Reverberation?

The amount of sound energy a material will absorb is known as the absorption coefficient.

Typically reverberation is controlled by introducing sound absorbing surfaces. More effective absorbers and increased coverage within a room will lead to lower reverberation times.

Practical Implications

Once the size of a room and the absorption characteristics of the finishes are known, an acoustician can predict the reverberation time. They can then calculate the amount and type of sound-absorbing material to be included to meet a particular room's usage and a designer's preference.

Apart from sport activities, sports halls are also used for exams and assemblies, acoustic demands are therefore very high and complex. Having large amounts of sound absorption is necessary to achieve a pleasing acoustic environment. The choice of materials is also essential as they need to be impact resistant.

Sound absorption should be distributed within a room with a minimum of 25% from the walls, 30% from the soffit and the remaining 45% provided by finishes on any of the room surfaces. It is beneficial for the sound absorption materials to be installed at a lower level rather than higher to improve their effectiveness.

In our experience, sports teachers are more prone to having throat or voice issues than any other subject teachers, as they need to raise their voice due to high levels of background noise.

Good acoustic design is important because long reverberation times result in:

- *Low speech accuracy*
- *Excessive levels of background noise*
- *Raised levels of stress for users*
- *Controlling and management issues*

DYNAMIK's Recent Projects

Universities

- Cardiff Metropolitan University
- Manchester Metropolitan University
- Solent University, Southampton
- University of Bath
- University of Cambridge
- University of East London (UEL)
